

# A blood clot in the brain

## Ischemic stroke

You have just had a stroke, also called a cerebrovascular accident (CVA). This means a clot has formed in a blood vessel in your brain. This fact sheet will help you better understand what is happening to you and what you can do.

### What is this problem?

This type of stroke is caused by a clot that blocks blood flow in the brain. Sometimes the clot forms somewhere else in the body and then travels through the bloodstream to the brain.

This clot keeps the blood from circulating normally. Brain cells then die from a lack of oxygen, because the blood no longer reaches certain areas of the brain (this is called ischemia).

### Blood clot in the brain

## What are the main causes of this problem?

- High blood pressure (hypertension)
- High cholesterol (fat) levels
- Diabetes
- Obesity (overweight)
- Lack of exercise
- Poor nutrition
- Tobacco use
- Stress
- Alcohol and drug use

Certain factors increase the risk of stroke: being male, having a family history of stroke, and being elderly.

## What are the main possible symptoms?

You might have some of the following symptoms:

- weakness or paralysis of the right or left side (face, arm or leg, for example)
- difficulty reading, writing, speaking, thinking, learning new things, and calculating
- needing instructions for simple tasks (such as washing your hands)
- vision and memory problems: you forget about objects, people, and even parts of your body on your left-hand side (a phenomenon known as “neglect”).
- you may not realize you have this problem, and you get upset because you can’t do something (such as opening a door)

Learn the signs and symptoms of stroke so that you can react immediately if you ever have another stroke: **FAST**

### **FAST**

**Face:** is it drooping?

**Arm weakness** (are you unable to lift both arms to the same height?)

**Speech difficulty** (are you having trouble talking?)

**Time:** it’s an emergency -- call **911!**

## What can be the consequences of a stroke?

A stroke can change your life and the lives of your loved ones. After a stroke, you may have difficulty doing activities of daily living: eating, dressing, washing, going to the toilet, making a phone call, doing household chores, moving around, etc.

Other areas of your life could also be affected:

- > Morale and mental health: emotions, mood, behaviours, memory, thinking, organization.
- > Physical abilities: mobility of your hands, arms, and legs; your balance; control of urination and bowel movements; sensations and perceptions.
- > Communication abilities: understanding a message; speaking, articulating, or producing sounds.

It takes a lot of effort to recover from a stroke. There are ups and downs. Don’t hesitate to ask for help and to talk about your concerns.

## What tests or exams might be done?

Some procedures that might be done when you arrive at the hospital include:

- a complete physical examination
- blood and urine tests
- heart function tests
- imaging tests (scans, MRI, ultrasound, etc.) to look at your brain and see how the blood is circulating, to examine your heart and lungs, etc.
- a device (a Holter monitor) that you would wear for 1 or 2 days to record your heart rhythm

## How is this illness treated?

In the first few hours after a stroke, the care team will focus on:

- finding out what is happening to you (diagnosis)
- stabilizing your condition
- treating you as quickly as possible

At the hospital, to treat you, a medication (Alteplase) may be used to dissolve the clot. It should be taken within 4.5 hours after the first signs of stroke. See the fact sheet [Treating stroke with medication - thrombolysis](#).

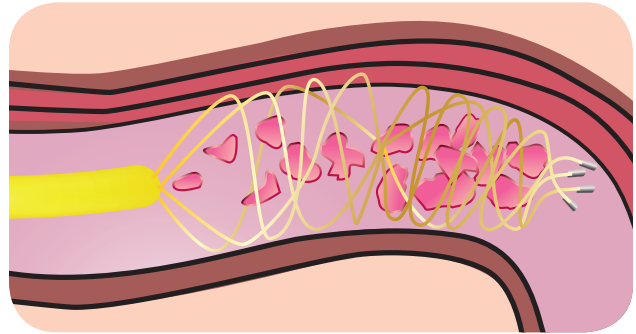

However, this medication is not suitable for everyone who has this type of stroke.

Thrombolysis

Depending on the case, other treatments are possible:

- > Removing the clot, using a small tube (catheter). See the fact sheet [Treating stroke with a procedure - endovascular thrombectomy](#).

Thrombectomy

- > Removing the fat or calcium that has settled in the carotid artery (the artery in the neck that brings blood to the brain). This is only done if blockage of the carotid artery is the cause of the stroke.

## How do I take care of myself in the first few days after the stroke?

- Ask for help from a member of the care team to change position and to get out of bed carefully.
- Drink and eat as directed by the health care team. First, they will check to see if you have difficulty swallowing. See the fact sheet [Detecting difficulties with swallowing](#).
- Follow the care team's instructions. They will encourage you to gradually resume your personal hygiene care and your activities.

The team will plan your follow-up care (rehabilitation, discharge from hospital, return home, etc.) with you and your loved ones.

## Will my medications be adjusted after the stroke?

If you were taking medication before (for diabetes, blood pressure, clotting, etc.), your doses may be changed.

You may also have to take some new ones. The doctor and nurse will tell you.

Medications can reduce the risk of having another ischemic stroke. Their purpose is to:

- lower your blood pressure (antihypertensive drugs)
- thin your blood and prevent another clot from forming (antiplatelet drugs)

## What symptoms should I be watching out for?

Tell the nurse if you have new symptoms or if your symptoms become worse. These can include:

- pain
- headache
- nausea (feeling like you might vomit)
- tingling in the throat
- trouble breathing
- worsening of symptoms you already have (more weakness, more trouble talking, etc.)

## Can I help prevent another stroke?

Yes, there are steps you can take to reduce your risk:

- Stop smoking, if you haven't already done so.

- Eat a balanced diet low in fat and salt. Consult a nutritionist if necessary.

- Exercise for at least 20 minutes, 5 times a week.
- Take your medicine to lower blood pressure and cholesterol (fat) levels as prescribed by your doctor, if applicable.
- Monitor your diabetes by checking your blood sugar regularly, if necessary.
- Lose weight, if necessary.
- Reduce stress.

## Who should I contact for help or to ask questions?

### In the hospital:

Members of your care team can answer your questions.

### When you are back at home:

You can call your doctor or any member of the care team following you.

Tel.: .....
